

ACTIVITY 13 | GLOBAL TECH AMBASSADOR & OPEN-SOURCE PATHWAY SELECTION

Trivikram Kalagi | B.Tech CSIT | REVA University | Semester 3

1. Target Program Selection

Selected pathways: GitHub Campus Experts and GirlScript Summer of Code (GSSoC). GSSoC has already been completed by me in 2026, so it is included as an established open-source pathway and evidence of prior contribution experience. GitHub Campus Experts is the forward-looking target aligned with my community and leadership goals.

Program	Eligibility / Cycle	Key Benefits	Fit / Status
GitHub Campus Experts	18+; active GitHub user (>6 months); >1 year remaining until graduation. Next cycle listed around Feb 2027.	Public speaking and leadership training; event funding.	Forward target. Strong fit through GitHub activity, GSSoC experience, projects, hackathons and AiFi community involvement.
GirlScript Summer of Code (GSSoC)	Annual cycle; listed as opening in late March. Completely open and beginner-friendly with no age/geographic barrier.	Git/GitHub mastery and beginner open-source contributions.	Already completed in 2026. Provides direct evidence of open-source participation and merged PR experience.

2. Readiness & Gap Analysis

Current evidence: My GitHub account was opened in September 2025. My profile currently shows 319 contributions in 2026, 14 followers and 17 following, with multiple public repositories including Litigo, SIDDHI, TATHYA, Kisan_Platform, leetcode-solutions, ContractLens-AI and My_Portfolio. I also have merged GSSoC pull requests and one year of AI/tech community involvement through the AiFi Club.

- **Strength:** Proven open-source participation through GSSoC, including merged pull requests, gives me practical Git/GitHub workflow experience.
- **Gap 1 — Community leadership depth:** I have AiFi Club experience, but limited evidence of independently organizing recurring technical events or leading a developer community.
- **Gap 2 — Technical communication:** I have written project/research reports and LinkedIn technical posts, but need a more consistent public record of concise technical explanations and contribution narratives.
- **Gap 3 — Open-source consistency:** I have merged contributions and an active GitHub history, but activity is concentrated around contribution periods rather than a long continuous contribution pattern.
- **Gap 4 — Independent engineering depth:** My portfolio shows strong project experimentation and hackathon work, but I need more public evidence of end-to-end ownership, testing, debugging and maintainable engineering.

3. Four-Week Preparation Roadmap

Week	Focus	Actions	Output
1	Profile readiness	Audit GitHub; improve pinned-project descriptions/readmes; organize strongest AI, DSA and open-source evidence.	Clearer GitHub profile and project evidence.
2	Community leadership	Document AiFi/community experience; study how Campus Experts run technical events; outline one practical student developer session.	Community leadership plan and session outline.
3	Technical writing	Turn one real project into a concise technical write-up covering architecture, decisions, debugging and lessons learned.	One polished technical article/report.
4	Application package	Prepare CV/GitHub links; draft motivation answers; review eligibility and evidence; rehearse a concise technical introduction.	Application-ready profile, links and motivation draft.

4. Evidence of Prior Open-Source Experience

The GSSoC 2026 Certificate of Participation below provides direct evidence that I have already participated in a structured open-source program. This is why GSSoC is treated as an established pathway in this analysis rather than a new activity I need to start.

Evidence shown: GirlScript Summer of Code 2026 participation and contributions, issued in the name of Trivikram Kalagi.

5. Drafted Technical Community Motivation

I am a B.Tech Computer Science and Information Technology student focused on AI/ML, Generative AI, DSA, software development and AI automation. I am most motivated by communities where learning is tied to building, reviewing and sharing real technical work. My approach usually starts with research: I explore documentation, GitHub repositories, APIs, implementation patterns and technical references, then move into coding, testing, debugging and iteration. This has led me to build projects such as Litigo, which won 3rd prize at the YC Fall 2026 x Moss: The Zero Latency Builder Sprint, SIDDHI, an AI-powered situational intelligence platform, and Tathya, selected in the Top 50 of the Scrape-Verse Hackathon. I have also completed GirlScript Summer of Code 2026 and contributed through merged pull requests. I want to deepen this experience by contributing in environments where developers review each other's work, discuss trade-offs, and improve software collaboratively. GitHub Campus Experts appeals to me because it combines technical community building with communication and leadership. I would bring curiosity, persistence, hackathon experience, open-source exposure and a strong willingness to learn, contribute, document what I discover, and help other students move from learning concepts to building working systems.

6. Personal Positioning

Core direction: AI/ML + GenAI + Open Source + Community Leadership. My strongest current evidence is project building, hackathons, GitHub activity and completed GSSoC participation. The next step is to turn that foundation into more continuous community leadership, technical communication and public engineering evidence.
