

Activity 12 — Building Your Portfolio Blog by Prompting an AI Assistant

Submission Document

Course: Portfolio Building | B.Tech CSE, REVA University

Name: Trivikram Kalagi

GitHub: trivikramkalagi91-commits

Email: trivikramkalagi91@gmail.com

1. Portfolio Brief

Who I am. I am Trivikram Kalagi, a Computer Science & Engineering undergraduate at REVA University, focused on software engineering and AI automation. I build AI agents and automation tools that do real work — from crime analytics for the Karnataka State Police to hackathon-winning platforms and open-source contributions. My long-term goal is to found my own AI automation startup.

Activities 1–4 (prior course work). Activity 1 (VS Code setup): I configured my local development environment and verified my toolchain. Activity 2 (Git & GitHub): I created my GitHub account, learned the commit/pull/push workflow, and published my first repositories. Activity 3 (GitLens & Live Share): I used Live Share for pair-programming sessions and kept a collaboration log; GitLens helped me review commit history and blame. Activity 4 (LeetCode practice): I maintained a LeetCode solutions repository with documented approaches and progress tracking.

Shipped projects (additional context). Beyond the course activities, I have shipped four public projects: SIDDHI (AI crime-analytics platform for Karnataka State Police, Lead AI Engineer), MediExpiry AI (healthcare medicine-expiry alert platform, deployed on Vercel), Kisan Platform (agri-tech platform, 3rd Prize hackathon), and GSSOC open-source contributions (10+ merged PRs across SecDev, StorySpark AI, and reframe).

Skills. Languages: Python, JavaScript/TypeScript, C++, SQL. AI/ML: LLM integration, NLP, agentic AI, prompt engineering. Web: Next.js, React, Node.js, Tailwind CSS, Framer Motion, Vercel. Tools: Git, GitHub, Docker, VS Code, GitLens, Live Share.

Career / learning goal. To design and ship production-grade AI automation products that solve real problems, and to build the engineering and product skills needed to eventually found an AI automation startup.

Portfolio design intent. A one-page personal portfolio blog with sections: About, Projects (with working links to my GitHub repositories), Skills, and Contact. Tone: professional but approachable. Visual style: dark neo-brutalist theme with a neon-lime accent, large condensed display type, floating code-window motifs, and sharp square corners — energetic and memorable while keeping all content accurate and links functional.

2. Prompt Log

Initial generation prompt and every follow-up refinement, with the change produced in the output.

#	Prompt sent to AI assistant	What changed in the output
1 (initial)	Generate a complete one-page personal portfolio blog for Trivikram Kalagi (B.Tech CSE, REVA University) with sections: About, Projects, Skills, Contact. Include working links to my GitHub repositories. Tone professional but	Produced v1: a complete single-page portfolio (dark amber editorial style) with all four real projects, correct links, skills, and contact info. Layout worked but alignment/spacing needed refinement.

	approachable. Use a dark theme with an accent color, large headings, and a modern layout. All content must be accurate — no invented projects.	
2	Redesign the portfolio in a light, professional AI-product aesthetic: soft indigo/violet/cyan gradients, glassmorphism cards, clean typography, generous whitespace. Keep all real content and links unchanged.	Produced v2: light glassmorphism theme. Review found it looked generic and the user wanted a more distinctive, high-impact look.
3	Redesign again as a dark neo-brutalist portfolio inspired by a reference reel: pure black background, neon-lime (#CCFF00) accent, huge condensed uppercase display type (Anton), the developer portrait surrounded by floating VS Code-style code windows, an accordion 'What I can do' services list, and bold marquee strip. Keep all real projects/links.	Produced v3: brutalist lime theme with floating code windows, accordion services, project list rows, timeline, contact CTA, and contact modal. Matched the reference aesthetic.
4	Fix spacing and alignment: the experience timeline is too narrow and cramped, the 'Got a project?' contact CTA is not centered, and the floating code windows overlap the portrait face. Widen the timeline, center the CTA content, and reposition the floating windows outward.	Timeline widened (max-w-5xl), card padding and text size increased, contact CTA centered with more padding, code windows pulled outward and reduced in size.
5	Add more structure: accordion and project rows blend together with no clear separation, and project rows leave the right half empty. Add zebra striping and thicker borders between rows, and restructure each project row to use full width	Zebra striping + 3px brighter borders added; project rows became a 12-column grid (number title+desc tech tags code+arrow) filling full width; timeline widened further to max-w-7xl.

	with a right-hand tech-tags column.	
6	Remove all rounded corners — use sharp square corners everywhere (true brutalist). Make the row borders thicker and brighter. Redesign the 'Got a project?' CTA as a sharp lime square with a thick black border and an offset black shadow, with a bigger bold heading and a square black button.	Global border-radius forced to 0 (cursor/orbs exempt); row borders 3px brighter; contact CTA rebuilt square with 4px black border, 12px offset shadow, larger heading, square black button.
7	On mobile there is an empty gap on the right side of the page. Prevent any horizontal overflow and slightly reduce the mobile hero font size so the page always fills edge-to-edge.	overflow-x:hidden + max-width:100% applied to html/body/main; hero mobile font reduced from 16vw to 14vw. Page now fills the viewport on all screen widths.

3. Published Portfolio

Live site: <https://my-portfolio-bbl.vercel.app> (deployed via Vercel, auto-built from the GitHub repository below).

Source repository: https://github.com/trivikramkalagi91-commits/My_Portfolio (main branch, published through GitHub with the final generated index page).

Linked project repositories: SIDDHI — github.com/trivikramkalagi91-commits/SIDDHI · MediExpiry AI — github.com/trivikramkalagi91-commits/MediExpiry · Kisan Platform — github.com/trivikramkalagi91-commits/Kisan_Platform · LeetCode & open-source profile — github.com/trivikramkalagi91-commits.

Note: The final generated page can also be uploaded as index.html to a <username>.github.io repository via GitHub's web interface (Add file → Upload files) to publish at <https://trivikramkalagi91-commits.github.io> — the same generated HTML is used either way.

4. Reflection

The prompt that produced the biggest improvement was Prompt 3 — the detailed redesign brief referencing the neo-brutalist reel, which specified the exact color, typeface, layout motifs, and section behaviors. It transformed the page from a generic template into a distinctive,

memorable portfolio. One thing the AI got wrong that had to be corrected: the first generated layout had cramped, misaligned spacing (narrow timeline, off-center CTA, overlapping floating windows) and used rounded corners instead of the sharp brutalist corners intended — both were fixed through follow-up prompts without any manual code edits.
